

Brief ISP Cacti Traffic Report.

Period Reviewed:

Traffic graphs captured from the ISP Cacti monitoring platform across multiple interfaces.

- Average bandwidth utilization remains well below the maximum interface capacity for most of the observed period.
- No prolonged periods of link saturation (100% utilization) were observed.
- Peak utilization appears during business hours, while traffic reduces significantly during off-peak periods.
- A few interfaces display intermittent high outbound traffic, suggesting scheduled backups, file transfers, or bulk data synchronization.
- The inbound and outbound traffic levels are generally balanced, indicating normal bidirectional communication.

Network Consumption Assessment

- **Normal Consumption:** Most links are operating within acceptable utilization levels.
- **Peak Consumption:** Short-duration peaks occur but do not remain sustained long enough to indicate persistent congestion.
- **Bandwidth Availability:** Adequate bandwidth headroom exists on the majority of the monitored circuits.
- **Performance Impact:** No obvious indication of bandwidth exhaustion or persistent bottlenecks was observed from the graphs.
